

CHIP VERIFY

Checking Electronic Travel Documents With Your Mobile Phone

CHIP VERIFY -  anytime,  anyplace,  anyconnection

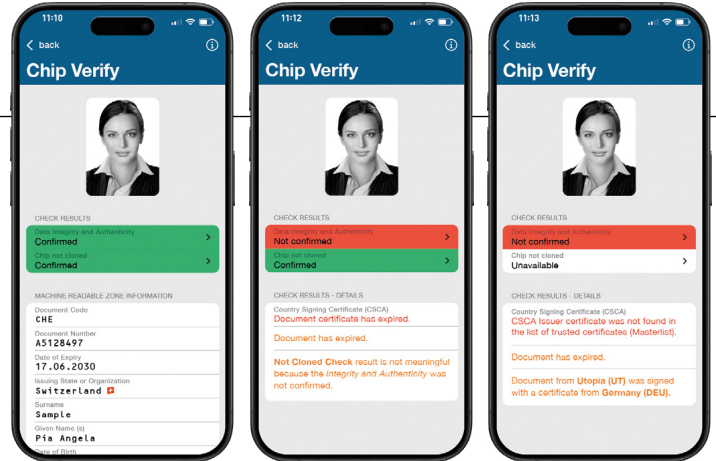

About CHIP VERIFY

CHIP VERIFY is a state-of-the-art solution for the verification of identity documents. The technology seamlessly communicates with virtually all electronic, i.e. chip-equipped, travel documents, verifying their authenticity and integrity and uncovering cloned

documents. It not only displays the photo of the ID holder, but also the personalization stored in the chip, thus ensuring maximum security during identity checks.

How CHIP VERIFY Works

The CHIP VERIFY technology carries out a standardized document check in accordance with ICAO 9303 and can check identity documents from over 100 countries. It supports police forces in particular, but also border control officers or security services. CHIP VERIFY enables fast and reliable verification of electronic ID documents for their authenticity, issuer and possible manipulations. The solution can be installed as an app on existing work phones – no additional devices are needed. The mobile phone's NFC antenna communicates with the chip of the ID document in question.

Valid Swiss passport showing the personal information read from the chip.

Expired Swiss passport with detailed examination results.

Complete forgery "UTOPIA" passport with detailed examination results.

How You Benefit From CHIP VERIFY

CHIP VERIFY enables the user to interpret test results beyond any doubt without having to rely on in-depth technical knowledge. This facilitates the identification of irregularities and supports police forces and other users in making quick decisions. Existing work phones can be optimally used – no additional tools are

required. Like all police apps from OVD Kinegram, CHIP VERIFY can be seamlessly integrated into existing apps and does not require any connections to third-party systems outside the police network. CHIP VERIFY is a self-contained app and can be used both online and offline.
